

H-Bridge Motor Driver 2.5V~6V, 0.45Ω Peak current limiting protection:2.5A

1 Description

The CN8001A is an H-bridge motor driver used for driving reversible motors, which can drive one DC motor, one winding of a stepper motor, or other loads.

The CN8001A operates on a motor power supply voltage from 2.5V to 6V, With 2.5A current limit.

The CN8001A is controlled by two input pins. The two on/off inputs determine the output mode: forward, reverse, coast, or brake. Very low standby circuit current can be achieved when the two inputs are both at a low level.

The CN8001A is available with DFN2x2-8, SOT23-6, SOP-8 or ESOP-8 package.

2 Features

- Wide Power Range: 2.5V to 6V
- Peak current limiting protection:2.5A
- Low MOSFET On Resistance: $R_{DS(on)}=0.3\Omega$, $R_{DS(on)}=0.15\Omega$
- Forward, Reverse, Coast, or Brake Output Modes
- Suitable for wide range MCU control logic
- Input logic hysteresis
- Thermal Shutdown
- OCP: 2.5A

3 Applications

- Smart BreakerSmart Lock
- Smart Water/Gas Meter
- Toys

11 Detailed Description

11.1 Overview

The CN8001A is an H-bridge driver that can drive a DC motor or other devices such as solenoid valves. Outputs can be controlled via the CN8001A's PWM interfaces (INA and INB). These devices integrate the necessary driver FETs and FET control circuits, thereby greatly reducing the number of components in a motor driver system. In addition, the CN8001A adds protection functions that go beyond conventional discrete implementations: overcurrent protection and thermal shutdown.

11.2 RPM Adjustment

PWM (Pulse Width Modulation) technology achieves precise control of motor speed by adjusting the duty cycle of the pulse signal. This technique regulates the average value of the motor input voltage and thus controls the motor speed by changing the duty cycle of the PWM signal, i.e., the ratio of the pulse width to the pulse period. Specifically, the larger the duty cycle of the PWM signal, the higher the average value of the motor input voltage and the faster the motor speed; on the contrary, the smaller the duty cycle, the slower the motor speed.

11.3 Motor Control

The CN8001A is controlled via PWM input connectors (INA and INB connectors). Each output is controlled by the corresponding input pin.

INA	INB	OUTA	OUTB	Functions (DC motors)
L	L	Hi-Z	Hi-Z	Coast
L	H	L	H	Reverse
H	L	H	L	Forward
H	H	L	L	Brake

11.4 OCP

There is an analog current limit circuit on each field effect transistor that limits the current through the field effect transistor by eliminating gate drive. If the analog current limit analog current limit lasts longer than t_{DEG} , all field effect transistors in the H-bridge are disabled. Operation is automatically resumed after t_{RETRY} . Overcurrent of the field effect transistors is detected by both the high voltage side and the low voltage side FETs. overcurrent can be caused by a short circuit between the OUTA pin and the OUTB pin or by grounding the OUTB pin.

11.5 OTP

If the chip temperature exceeds 155°C , all field effect tubes in the H-bridge are disabled. Operation is automatically resumed when the chip temperature drops below 130°C .
